+91 96994 97009

As a web developer, I am skilled in HTML, CSS, and JavaScript, which allows me to create dynamic and interactive websites. I also have experience with Node.js and Express, which are powerful back-end frameworks that help me build scalable and high-performing web applications.

Additionally, I have expertise in MongoDB, which allows me to store and manage data efficiently, making it possible to create robust and scalable databases that can handle large amounts of information.
Moreover, I am familiar with Tailwind CSS, a popular CSS framework that helps me quickly create custom styles and layouts for web pages. This enhances my ability to create visually stunning and responsive designs without having to write custom CSS from scratch.

Lastly, I have experience with React.js, which allows me to build complex and interactive user interfaces, including reusable UI components that can be easily integrated into different web pages. Overall, my skillset enables me to create end-to-end web applications that are scalable, performant, and user-friendly, with visually appealing designs that are easy to navigate.
